

## Sequence and Series (A.P.)

**Concept:** If a sequence is in A.P., then its  $n$ th term will be a linear expression in  $n$  and thus the common difference ( $d$ ) will be equal to the coefficient of  $n$ .

**Problem 1:** Let the  $n$ th term of an A.P. is  $t_n = 4n - 3$ , find the common difference  $d$  ?

**Solution:** as per theorem we know that if  $t_n$  is in linear expression then  $d$  will be the coefficient of  $n$ , so answer is 4.

**Problem 2:** Let the  $n$ th term of an A.P. is  $t_n = 9n + 6$ , find the common difference  $d$  ?

**Solution:** as per theorem we know that if  $t_n$  is in linear expression then  $d$  will be the coefficient of  $n$ , so answer is 9.

**Concept:** A sequence will be in A.P. if its sum of first  $n$  terms is in the form of  $An^2+Bn$ , (expressed as quadratic expression), where  $A$  and  $B$  are constants (pure number) and independent of  $n$ . In this case common difference will be equal to,

$2 \times \text{coefficient of } n^2 = 2.A = \text{double of coefficient of } n^2.$

**Problem 3:** The sum of the first  $n$  terms of a particular sequence is in the form of  $3n^2+2n$ , find its common difference (d).

**Solution:** As per above discussion the sum of first  $n$  terms are expressed in quadratic form, so it will give us an A.P. whose common difference will be  $6.(2 \times \text{coefficient of } n^2)$

**Problem 4:** The sum of the first  $n$  terms of a particular sequence is in the form of  $6n^2 - 9n$ , find its common difference (d) ?

**Solution:** As per above discussion the sum of first  $n$  terms are expressed in quadratic form, so it will give us an A.P. whose common difference will be  $12.(2 \times \text{coefficient of } n^2)$

**Problem 5:** If  $s_n = n^2 + 9n$  (sum of first  $n$  terms of a particular sequence) find its common difference (d) ?

**Solution:** As per above discussion the sum of first  $n$  terms are expressed in quadratic form, so it will give us an A.P. whose common difference will be  $2.(2 \times \text{coefficient of } n^2)$

**Problem 6:** If  $s_n = \sqrt{3}n^2 + n$  (sum of first  $n$  terms of a particular sequence) find its common difference (d) ?

**Solution:** As per above discussion the sum of first  $n$  terms are expressed in quadratic form, so it will give us an A.P. whose common difference will be  $2\sqrt{3}.(2 \times \text{coefficient of } n^2)$
